

**After Lecture 05 & 06** – Answer any questions on HW1  
Practice Problems (all taken from previous exams)

1. What are the max number of levels in the recursion tree for this recurrence relation?

$$T(n) = T\left(\frac{n}{4}\right) + T\left(\frac{3n}{4}\right) + n$$

- a)  $\log_4(n)$
  - b)  $\log_2(n)$
  - c)  $\log_{\frac{4}{3}}(n)$
  - d)  $\log_{\frac{1}{3}}(n)$
2. Under what case of Master's Theorem will the recurrence relation of binary search fail?
- a) 1
  - b) 2
  - c) 3
  - d) It cannot be solved using Master's Theorem.
3. What is the purpose of using randomized quick sort over standard quick sort?
- a) Improve the worst-case runtime
  - b) To eliminate the possibility that a particular input order will always yield worst-case runtime
  - c) To improve accuracy of output
  - d) To improve average case time complexity
4. The non-recursive work in quicksort is done in which step of the divide-conquer-combine algorithm?
- a) divide
  - b) conquer
  - c) combine
  - d) none
5. Give big-O bounds of  $T(n)$  in each of the following recurrences. Use induction, iteration or Master Theorem.

5a)

$$T(n) = T(n - 1) + n; T(1) = O(1)$$

$$T(n) = n + T(n - 1)$$

$$T(n) = n + n - 1 + T(n - 2)$$

$$T(n) = n + n - 1 + n - 2 + T(n - 3)$$

$$T(n) = n + n - 1 + n - 2 + \cdots + T(1)$$

$$T(n) = n + n - 1 + n - 2 + \cdots + O(1)$$

$$T(n) = \sum_1^n n$$

$$T(n) = O\left(\frac{n^2 + n}{2}\right)$$

$$T(n) = O(n^2)$$

5b)

$$T(n) = 2T\left(\frac{n}{4}\right) + n^{\frac{1}{2}}; T(1) = O(1)$$

5c)

$$T(n) = T\left(\frac{n}{4}\right) + T\left(\frac{n}{2}\right) + n^2; T(1) = O(1)$$

6. Throughout this course, we assume that parameter passing during procedure calls takes constant time, even if an  $N$ -element array is being passed. This assumption is valid in most systems because a pointer to the array is passed, not the array itself. This problem examines the implications of three parameter-passing strategies:

1. An array is passed by pointer. Time =  $\theta(1)$ .
2. An array is passed by copying. Time =  $\theta(N)$ , where  $N$  is the size of the array.
3. An array is passed by copying only the subrange that might be accessed by the called procedure. Time =  $\theta(q - p + 1)$  if the subarray  $A[p \dots q]$  is passed. Use  $n = q - p + 1$ , where  $n$  is the size of the subarray passed.

Consider the recursive binary search algorithm for finding a number in a sorted array. Give recurrences for the worst-case running times of binary search when arrays are passed using each of the three methods above, and give good upper bounds on the solutions of the recurrences. Let  $N$  be the size of the original problem and  $n$  be the size of a subproblem. Binary search works by comparing the element for which you are searching to the element at index  $\frac{p+r}{2}$  of a subarray of size  $n$ , where  $p$  is the first index of the subarray and  $r$  is the last index (integer division is used). Therefore, the array passed in binary search is continually divided in half.

1)

$$T(n) = T\left(\frac{n}{2}\right) + O(1) \text{ with } T(1) = O(1)$$

The array is passed by pointer, which is constant time. Therefore, the time involved in the

2)

7. Use the definition of  $\Theta$  and induction to prove that the recurrence  $T(n) = T(N - 1) + \theta(n)$  (worst case Quicksort) has the solution  $T(n) = \Theta(n^2)$ . Since we are not given any boundary conditions, we can assume the basis step for the inductive proof. Assume the claim is true for  $n = k$ .

$T(k) = \theta(k^2)$ , in other words assume  $c_1 k^2 \leq T(k) \leq c_2 k^2$  for some  $c_1 > 0$ ,  $c_2 > 0$  and  $k$  large enough.

Use that to prove the claim

8. What is you are sorting a collection of data that can have multiple entries of some of the values. When calling Quicksort's  $\text{PARTITION}(A, p, r)$ , where do elements equal to the pivot end up and why?

How could we modify Quicksort and Partition (write pseudocode) so that if we happen to partition on a pivot that had many duplicate values, we can improve the runtime of Quicksort by having smaller recursive calls?

---

#### Algorithm 1 Quicksort1

---

```

1: function QUICKSORT1( $A, p, r$ )                                ▷
2:   if  $p < r$  then
3:      $(q_1, q_2) = \text{PARTITION1}(A, p, r)$                       ▷ two return values
4:      $((A, p, q_1 - 1))$ 
5:   end if
6: end function

```

---

---

#### Algorithm 2 Partition1

---

```

1: function PARTITION1( $A, p, r$ )                                ▷ Two return values
2:    $\text{endLow} \leftarrow p - 1$ ,  $\text{endEqual} \leftarrow p - 1$ 
3:    $\text{pivot} \leftarrow A[r]$ 
4:   for  $j=p$  to  $r-1$  do
5:     get function
6:   end for
7: end function

```
